INTRODUCTION

This project is a Blood Bank Management System developed using Java GUI. It helps manage donor records, blood availability, and search operations efficiently. The system uses Object-Oriented Programming concepts for better structure and design.

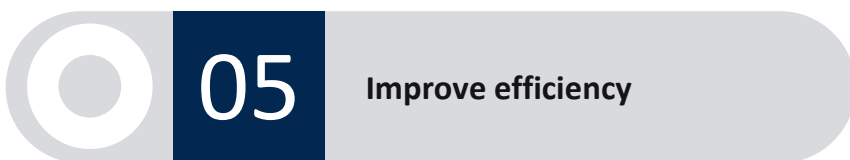

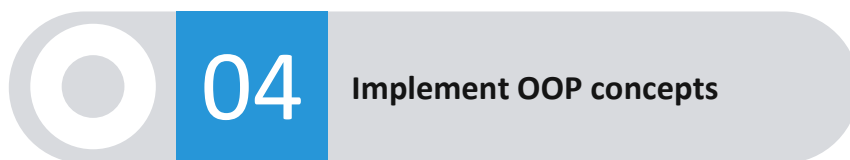

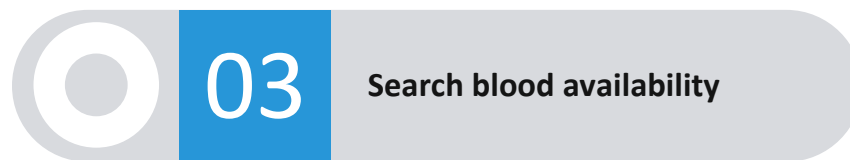

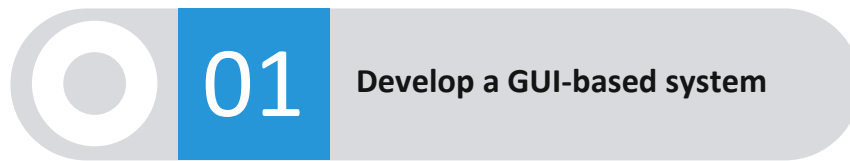

THE PROBLEM

The current blood bank system is mostly manual, making it slow and error-prone. It is difficult to quickly find blood in emergencies, and there is a risk of data loss and incorrect records. This can cause delays in providing blood to patients..

THE SOLUTION

We are developing a **GUI-based Blood Bank Management System** to automate data handling. It will help in adding donor details, searching blood quickly, and storing data properly. Using OOP concepts, the system will be efficient, easy to use, and reliable.

OBJECTIVES

OOP CONCEPTS USED

01

ENCAPSULATION

USING PRIVATE
VARIABLES AND
GETTERS.

02

ABSTRACTION

USING ABSTRACT
CLASS PERSON.

03

INHERITANCE

DONOR AND
PATIENT
INHERIT FROM PERSON.

04

POLYMORPHISM

METHOD OVERRIDING
DISPLAYINFO().

05

ASSOCIATION

BLOODBANK MANAGES
DONOR AND PATIENT.

Programming Language: Java (Object-Oriented Programming)

GUI Framework: Java Swing for designing user-friendly interfaces

Database: SQLite for lightweight data storage (extendable to MySQL)

IDE: IntelliJ IDEA used for coding, debugging, and project management

Libraries Used: Java AWT & Swing packages

EXPECTED RESULTS

 Blood Bank Management System
